These seeds produce plants, which produce ripe fruit, in which the fructose:glucose content is determined using the marker gene; and (2) tomato plants produced by the method, and their fruit and seeds. The marker is useful for finding (and cloning) genes that produce tomatoes having superior taste characteristics. The marker gene is also useful in a method of breeding tomato plants for selecting plants producing fruit having desired characteristics, including a higher fructose:glucose ratio than that of standard L. esculetum. The molecular marker enables the selection of tomato plants at the young seedling stage, and eliminates undesirable environmental effects on the plant phenotype, which can limit the effectiveness of selection for a phenotype characteristic. The present sequence represents a primer used in
The present invention describes a UL9 substrate comprising: a first strand (A) including a UL9 herpes replication origin sequence and a first single stranded tail 3' relative to the herpes replication origin sequence; and a second strand (B) including a sequence complementary to the UL9 herpes replication origin sequence. The UL9 substrates are usefu for detecting UL9 helicase activity in combination with ICP8 and ATP and also detecting the abbility of the combination with ICP8 and helicase activity. Immobilised UL9 substrate is useful for detecting herpes infected samples. AAA87951 to AAA87967 represent specifically claimed herpes replication origin sequences given in the present
                                                                                                                                                                                                                                                                                                                                                                                               Substrate for detecting helicase activity in a UL9 protein, comprises strand including a herpes replication origin sequence and another straincluding a complementary sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 UL9 substrate; herpes simplex virus; HSV; herpes; detection; helicase; replication origin; infection; ds.

                                                                                                                                                                                                                                         The present sequence is that of PCR primer Rat-3 Syk, which corresponds to nucleotides 748-762 of rat Syk mARA. Rat-3 Syk was used with primer Rat-5 Syk (see AAH26015) in the PCR amplification of rat Syk cDNA derived from RBL-2H3 mast cells. An experiment was performed to demonstrate inhibition of histamine release from RBL-2H3 cells by a stem-loop antisense oligonucleotide (see AAH26020) of the invention. The invention provides a claimed method of inhibiting the release of a mediator from a Syk-producing cell. This involves introducing into the cell an antisense construct that targets an Syk encoding sequence such that inhibition is effected. The cell is preferably present in the lung of an asthma patient. Also claimed is a method of treating an inflammatory condition in a patient by administering an antisense construct that targets Syk
                                                                                                                                                              Sequence 18 BP; 4 A; 6 C; 4 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Syk; tyrosine kinase; rat; antisense; asthma; gene therapy; antiasthmatic; inflammation; antiinflammatory; phagocytosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting the release of a mediator from a Syk-producing ce-
gene therapy for treating inflammatory conditions or asthma,
introducing into the cell Syk antisense oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2001-380484/40.

                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel oligonucleotide primer comprises in the following order, from 5' to 3': a phage-encoded RNA polymerase recognition sequence; a spacer sequence comprising a sequence of 12-21 nucleotides; and a target complementary sequence that can bind a segment of a target nucleic acid. The oligonucleotide primer is useful in amplifying a target nucleic acid. The original primer is also useful for copying intermediate duplexes and target nucleic acids. This polymucleotide represents an example of a spacer sequence between an RNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotide primer having phage-encoded RNA polymerase recognition sequences, spacer sequences and target complementary sequences, useful in nucleic acid amplification procedures or fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUN-2001;

                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for preventing phagocytosis of CC immune complexes comprises introducing an inhibitor of a kinase CC endogenous to phagocytic cells associated with an Fc receptor at the CC endogenous to phagocytic colls associated with an Fc receptor at the CC of the cells is inhibited. The method of the invention may have immunosuppressive, dermatological, antiinflammatory, antiarthritic, CC antirheumatic and antiasthmatic activities and may be used as a kinase complexes with cellarance of antibody coated cells, viruses and soluble complexes with cellular to tissue Fc receptors. The method is used commune complexes with cellular to tissue Fc receptors. The method is used commune complexes with cellular to tissue Fc receptors. The method is used commune complexed diseases, immune mediated diseases e.g. asthmace and immune complex diseases e.g. lupus erythematosus and rheumatoid conthitis, and for preventing immune complexes deposition in tissues e.g. the kidneys and in the joints. The present sequence represents a Rat Syk chase specific PCR primer used to quantify expression of Rat Sky cDNA in a cells treated with antisense oligonucleotides using the method of the

                                                                                                                                                                                                                           ş
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the use of constructs and compounds for modulating or regulating the clearance of antibody-coated cells or immune complexes from a mammal, comprising inhibiting the phagocytic potential cof cells bearing FC receptors. The invention also relates to preventing cof immune complexes in a mammal, preventing the clearance of immune complexes from a mammal, inhibiting the binding of immune complexes in a mammal, preventing the clearance of complexes present in a mammal to membrane-bound FC receptors, inhibiting the signal transduction of the gamma subunit of the IgB complexes pre-epsilon-RI. A method of preventing phagocytosis of immune complexes in a mammal comprises introducing into phagocytic cells of the complexes in a mammal comprises introducing into phagocytic cells of the complexes in a mammal comprises introducing into phagocytic cells of the complexes in a mammal comprises introducing into phagocytic cells of the complexes introducing into phagocytic cells of the complexes from a mammal by inhibiting the invention are useful for modulating or regulating the clearance of antibody-coated cells or immune complexes from a mammal by inhibiting the phagocytic cells bearing FC receptors. The method is useful for inhibiting phagocytosis. The methods are also useful for treating complexes including asthma. This sequence represents a reverse complexed in the invention.

CC transcriptase PCR (RT-PCR) primer used to amplify rat Syk mRNA used in the score of the invention.
                                                                                                                                                                                                                                                              Query Match

CC treatment of myocardial infarction or susceptibility to myocardial infarction, or susceptibility to myocardial infarction, an at-risk haplotype in the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a cc FLAP nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-CLO) gene promoter; in an individual who has at least one risk factor chosen from diabetes, hypertension, hypercholesteroleamia, elevated CC inflammatory marker chosen from C-reactive protein (CRP), serum amyloid CC inflammatory marker chosen from C-reactive protein (CRP), serum amyloid CC inflammatory marker chosen from C-reactive protein (CRP), serum amyloid CC metalloprotease type-1, matrix metalloprotease type-2, matrix CC metalloprotease type-3 and matrix metalloprotease type-2, matrix CC individual having increased low density lipoprotein (HDL) cholesterol in an individual having increased leukotriene synthesis; in an individual correction synthesis; in an individual correction synthesis; in an individual for treating an individual sufferring from acute coronary syndrome (ACS) cevent, stable angina; or in an individual who has atherosclerosis or who creating an individual sufferring from acute coronary syndrome chosen from CC unstable angina, non-ST-elevation syncardial infarction (NSTEMI) and ST-elevation syncardial infarction (STEMI). The human FLAP gene is located coronary invertice specifically to 13q12. The present sequence created in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes using a leukotriene synthesis inhibitor (I) for the manufacture of a medicament for the treatment of myocardial infarction or susceptibility to myocardial infarction in an individual. Also described is a method (M1) for the treatment of acute coronary syndrome (AcS) in an individual comprising administering (I). (I) has antiatherosclerotic, cardiant and antianginal activities, and can be used as a leukotriene biosynthesis inhibitor, and a leukotriene receptor antagonist. (I) can be use for the manufacture of a medicament for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 leukotriene synthesis inhibitor; myocardial infarction; acute coronary syndrome; antiaherosclerotic; cardiant; antianginal; acute coronary syndrome; antiaherosclerotic; cardiant; antianginal; leukotriene biosynthesis inhibitor; leukotriene receptor antagonist; 5-lipoxygenase activating protein; FLAP; human; chromosome 13; chromosome 13q12; polymorphism; 5-lipoxygenase gene promoter; diabetes; hypertension; hypercholesterolaemia; obesity; infilammatory marker; low density lipoprotein; cholesterol; high density lipoprotein; angina; atherosclerosis; microsatellite marker; high density lipoprotein; angina; atherosclerosis; microsatellite marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of leukotriene synthesis inhibitor for manufacture of for treatment for myocardial infarction or susceptibility infarction in individual.

                                                                                                                                                                                                                                     Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                  Sequence 19

                                                                                                                                                                                                                                                                                                                                            This sequence represents a PCR primer for DNA encoding a human gamma aminobutyric acid type B (GABAB) receptor of the invention. Nucleic acid molecules encoding GABAB receptors can be used to screen for compounds that are inhibitors of transient lower oesophageal sphincter relaxations (TLESR). They can also be used to screen for agonists or antegonists of the GABAB receptors. Inhibitors of TLESR are useful for treating gastro-oesophageal reflux disease. Other uses of GABAB receptors, such as human GABAB Rlc or 1d, comprise diagnosis or treatment of conditions related to GABAB dysfunction, e.g. epilepsy, psychiatric disorders, emesis, irritable bowel syndrome, dyspepsia, spasticity, arthritis, allergies, autoimmune diseases, neoplastic diseases, pain and infectious disease

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of their invention have a variety of uses they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as the treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                       The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 3' anchored (ISSR)-PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                   New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and animal systems.
                                                                                                                            Sequence 19 BP; 9 A; 1 C; 7 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a double-stranded short interfering conditions (sinA) that downregulates expression of the vascular conditions of that conditions of the vascular conditions of that express sinA; (3) conjugates and/or complexes of sinA; (4) vectors that express sinA; and (5) single-stranded sinA with similar properties. The sinAs are useful for modulating cophthalmological activities. The sinA are useful for modulating cophthalmological activities. The sinA are useful for modulating complexed conditions, are useful for treating a wide range of angiogenesis-associated conditions, convascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The sinA may also be useful for diagnosis, and polycystic kidney disease. The sinA may also be useful for diagnosis, conditions, target identification and validation, genetic engineering, target identification and validation, genetic single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local Similarity Matches 12; Conserv

                                                           ophthalmological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesia-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                            The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFN) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, cytostatic, antidiabetic,

The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor esgment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic, useful for genome fingerprinting, i.e. for

Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                          Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated prote (Fap-1) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-737949) which can be used as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAC61847 standard;

The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding grost. More generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding grost (heat shock protein (HSP)60) (GL) and grost (HSP)60) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the expression of GL or GS, is claimed. (I) have antibacterial, antiviral and antiproliferative activities, and can be used in antisense therapy and for inhibition of expression of grosts or grost. (I) are useful for inhibiting expression of GL or GS in cells or tissues in vitro. (I) are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                against nucleic acids encoding human Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The specification describes antisense compounds which are targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas ligand (FasL), or Fap-1. The antisense compounds are used to inhibit the expression of Fas, FasL or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compounds targeting nucleic acid encoding groEL or groES gene of microorganism, which hybridize with and inhibit expression of the genes, useful to inhibit growth of microorganism having the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense oligonucleotide; groE; groEL; groES; inhibitor; growth; microorganism; Escherichia coli; Streptcocccus pneumoniae; diagnosis; Streptcocccus pyogenes; Staphylococcus aureus; Pseudomonas aeruginosa; antibacterial; antiviral; antiproliferative; antisense therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-NOV-2000; 2000WO-CA001347
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25-MAY-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            also useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS gene in a microorganism (a bacterial cell or a circums) having a GL or GS gene which involves administering to the microorganism or to a cell infected with the microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by the microorganisms which involves identifying a eukaryotic organism crowding a pathological condition mediated by microorganisms having a GL or GS gene and administering (I) such that the growth of microorganism is cinhibited. The antisense compounds are utilised for diagnostics, therapeutics, prophylaxis and as research reagents and kits, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AAH56362 to AAH5637 and AAH56831 to AAH56854 represent PCR primers for groß sequences which are used in the exemplification of the present invention. ITS DNA sequences from M. fortuitum, M. chelonae, M. abscessus, M. vaccae, M. flavescens, M. asiaticum, M. porcinum, M. acapulcensis, M. chelonae, M. flavescens, M. asiaticum, M. porcinum, M. acapulcensis, M. diernhoferi genes were identified. The oligonucleotides derived from these sequences were used to develop PCR primers and hybridisation probes for detection and identification of Mycobacterium. ITS has a more polymorphic region than 16S rRNA and also has a conserved region. It is therefore highly effective as a target DNA for distinction of genotype. The oligonucleotide probes, attached to solid substrate, hybridise only with nucleotide sequences in ITS of specific mycobacteria, and thus they can detect and identify the specific mycobacteria, and thus they coligonucleotides can also detect and identify the specific mycobacteria generates or probes made from ITS of mycobacteria, it is possible to detect mycobacteria, it is possible to detect mycobacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

This invention relates to an antisense compound encoding Fas, Fas ligand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were

Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful the research purposes. The present nucleotide sequence is related to
                                                    New compounds antisense to nucleic acid encoding human necrosis factor receptor 2 are useful to treat disease mouse tumor necrosis factor receptor 2 expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0
```

The present invention describes compounds of 8-30 to a nucleic acid encoding human or mouse tumour r

necrosis

factor receptor

nucleobases antisense

                                                                                                                                                                                                                                         for genotyping Mycobacterium species, second probe for differentiating Mycobacterium tuberculosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Microarray for simultaneously genotyping Mycobacteria species, differentiating Mycobacterium tuberculosis strains and detecting antibiotic-resistant strains, comprises specific probes on a supp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or mouse TNFR2 comprising contacting cells or tissues in vitro with or of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a mouse TNFR2 antisense chimeric phosphorothicate oligonucleotide, which is given in the present invention
                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 12; Page 51; 76pp; English.

                                                                                                                                    fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism can be possible to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide useful for detecting single nucleotide in human gene.  \\
                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                          in specification, or a sequence having a base substitution. The investment relates to: an oligonucleotide containing single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as gi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single nucleotide polymorphism detection primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADF88178 standard; DNA; 20 BP

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                         The present invention relates to antisense compounds targeted to nucleic acids encoding human Fas (also known as Apo-1 or CD95), Fas ligand (Fasi, also Apo-1) and CD951), and Fas associated protein 1 (Fag-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits Fas, Fasi or Fap-1 mediated signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense
                                                                                                                                                                                                                                                                                                  autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18-SEP-2000; 2000US-00665615

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modified sugar molety, preferably a 2'-O-methoxyethyl (2'-MOE) sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of autoimmune or inflammatory diseases, and cancers associated with overexpression of constitutive activation of Fas, FasL, or Fap-1. The present sequence represents an antisense oligonucleotide used in the examples of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             translational termination region or 3'-untranslated region of a nucleic acid molecule encoding Fas, Fas ligand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent; a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Fap-1; anda preventing allograft rejection, ischaemia reperfusion injury or apoptosis in an allograft recipient. The antisense compound and pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammatory disease, e.g. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis, allograft rejection, e.g. cardiac, renal, hepatic or skin allograft and ischemia reperfusion injury. This sequence
                                                                            Diagnosing or determining cancer or increased risk of cancer in a patient, by testing Fanconi Anemia/BRCA pathway gene or protein fi cancer-associated defect, that indicates cancer or increased risk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound targeted to nucleic acid molecule encoding Fas or Fap-1, useful in diagnosing, treating or preventing autoimmune or inflammatory disease, cancer, apoptosis, allograft rejection or ischemia
                                                                                                                                                                                                                                                                                                                                                                              02-NOV-2001; 2001US-00998027.

A microarray of the invention is useful for determining if a patient has cancer, or is at increased risk of developing cancer, by hybridising a nucleic acid sample to the nucleic acid sequences from the array, and detecting the presence of mutations in FA/BRCA pathway genes in the nucleic acid sample from the patient, where detecting the presence of mutations is indicative of a patient who has cancer, or is at increased risk of developing cancer. A method of the invention is useful for screening a chemosensitising agent, and the agent obtained is useful for treating a patient having a cancer. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method of diagnosing or determining if a patient has cancer or is at increased risk of cancer, involving testing a Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a cancer-associated defect, where the presence of one or more cancer-associated defects is indicative of cancer or an increased risk of cancer in the patient. The method of the invention has cytostatic activity. The method is useful for determining if a patient has cancer, or is at
                                        This invention relates to a novel library of immunoglobulin (196) molecules. Specifically, it refers to prototype 196 molecules that each may comprise a mutation where a single predetermined amino acid has been substituted in one or more positions within one or more of the six
                                                                                                                                                                                                                                                                                                     New libraries for a prototype IgG (IgG) comprising mutated IgG or acids encoding a mutated IgG, useful for generating specific infor on particular mutations that alter interaction of an IgG with its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GP120; antibody; scFV; ss; library; walk-through mutagenesis; anti-HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 21 BP; 2 A; 4 C; 6 G; 9 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                      Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        monoclonal antibody (scFV). The present invention describes a method for generating a library of prototype mutant IgGs (for example IgM, IgA, IgD or a Fab fragment of IgG), which can be used to study protein structure and function via a walk-through mutagenesis procedure. Accordingly, the libraries may be used for the systematic analysis of the binding regions of prototype IgG molecules. Furthermore, it provides specific information regarding particular mutations that alter the interaction of an IgG with its antigen, including multiple interactions by amino acids of the varying CDRs. This oligonucleotide sequence is a degenerate human GP120 antibody VL CDR2 DNA oligo designed to introduce a targeted amino acid at one or more positions, a method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection; polymorphism; perfect compound simple sequence repeat; adaptor directed primer; genome; genetic; fingerprinting; amplified fragment length polymorphism assay; microsatellite region; genetic trait marking; germplasm comparisons; compound; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local
                                                                                           The invention relates to the preparation of microarrays, which involve the oxidation of chemical groups present on a solid support surface to allow the formation of aldehyde functions upon the surface. The aldehyd functions covalently couples with capture molecules designed for the detection, identification, quantification and/or the recovery of complementary target biological or chemical molecules. For preparing microarrays e.g. biochips or chemochips to detect, quantify and/or recover e.g. nucleotide sequences, ligands or antibodies, from sample e.g. detecting transcriptional factors. This polynucleotide sequence represents a PCR primer used to amplify the femA gene sequence from Staphylococcus aureus. This sequence is used in a method of the invention, involving the detection of target nucleotide amplicons on
                                                                                                                                                                                                                                                                                                          Preparation of microarrays e.g. biochips, involves oxidation of chemical groups present upon the support surface and allowing the formation of aldehyde functions at the surface of the solid support.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Microarray; oxidation; solid support surface; aldehyde function; biochip; capture molecule; chemochip; PCR; primer; femA gene; ss.

The method can be used to detect microorganisms and polymorphisms, and to diagnosis genetic discincluding cancer. The present sequence is a consensus primer us exemplification of the invention

New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anore, neurodegenerative disorders, Alzheimer's disease and cancer. disease, anorexia,

Page 562; 666pp; English.

The invention relates to human polypeptides, termed NOVX, and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), yalve diseases, tuberous sclerosis, scleroderma, septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders,

                                                               The present invention relates to a method for modulating gene expression in a cell. The method comprises modulating a binding interaction between an alphaCP polypeptide and a Hur polypeptide. The invention also discloses mRNA stabilising elements involved in the binding of alphaCP1, alphaCP2 and Hur proteins to mRNA. The method of the invention is useful for modulating gene expression, stabilising vascular endothelial growth factor (VEGF) mRNAs, for inducing angiogenesis, for treating mammalian diseases (e.g. coronary diseases, cardiac diseases, cancer), and identifying modulators of gene expression. The present sequence represents a mRNA stabilising element of the invention
                                                                                                                                                                                                                Modulating gene expression in a cell useful for treating cancer by modulating a binding CP polypeptide and a HuR polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modulating gene expression; alphaCP1; alphaCP2; HuR protein; mRNA stabilising element; vascular endothelial growth factor; VEGF; mRNA stabilisation; angiogenesis; coronary disease; cardiac disease; cancer; cytostatic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              . u
                                                                                                                                                                                                                                                                                                                                                                           genotyping animal syst
                                                                                                                                                                                                                                                                 The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.

Colman SD,
              The invention relates to human G-protein coupled receptor (GPCR) polypeptides and the polynucleotides encoding them, designated GPCRX. The invention also relates to a cettor comprising a GPCRX nucleic acid, a cell comprising the vector, an antibody that binds immunospecifically to a GPCRX polypeptide, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for the polypeptide or the nucleic acid molecule in a sample, methods for
                                                                                                                                                                                                                                      useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (CASALL/)

The composition and methods are useful in diagnosing, preventing or treating GPCRX-associated disorders, such as cardiomyopathy, atherosclerosis, diabetes, obesity, infections, cancer, Alzheimer's disease, parkinson's disease, athima, allergies, hypertension, retinal diseases, urinary retention, angina pectoris, crohn's disease, schizophrenia and manic depression. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The polypeptides are also useful as vaccines or as immunogens to produce antibodies. This sequence represents a PCR primer used to amplify human GPCRX cDNA of the

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

Example 1; Page 216; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I) (I) can have antipsoriatic, antiseborrheic, antisickling

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3567, are not actually given a sequence in the Sequence Listing from the

Claim 1;

Page 57; 87pp; English

This invention relates to the use of a retinoic acid receptor beta 2 (RARbeta2) and/or its agonist in the preparation of a medicament to c neurite development. RARbeta2 mediates the cellular effects of the vitamin A derived molecule retinoic acid. Sequences AAC61031-C61051 represent PCR primers specific for RARalpha, RARbeta, and RARgamma DN sequences. The retinoic acid receptor of the invention exhibits mootropic, neuroprotective and neurlaptic activities. A method using RARbeta2 to cause neurite development can be used for treating neurological disorders comprising neurological injury. Neurological disorders include Parkinson's disease, Alzheimer's disease, senility

The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their allelse, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                            Use of retinoic acid receptor beta 2 or its agonist development and treating neurological disorder such disease, Alzheimer disease and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Retinoic acid receptor beta 2; RARbeta2; neurite development; senility retinoic acid; nootropic; neuroprotective; neurleptic; schizophrenia; neurological disorder; Parkinson's disease; Alzheimer's disease; se; motor neurone disease; diabetes; AIDS; neuropathy; leprosy; PCR prime:

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAA86251 standard; DNA; 19

Invention, which contain a polymorphic base at position. In nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the set of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the first of the disease.
                                                      New hairpin and hammerhead ribozyme RNA encoding a cyclin or cell-cycle PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide

                                                                                                                                   The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinas other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. The present sequence represents a PCR primer used in the example from the compensation. The method of the invention is for determining the CC genetic predisposition to cancer in an individual by detecting hRAD54 CC mutations in a sample. hRAD54 is a gene thought to be present in tumours that display allelic imbalance at Ip32, the chromosomal band identified CC as one of four minimal regions of chromosome 1 deletion in breast CC carcinomas. hRAD54 is useful for production of proteins, inter alia, that have been identified as novel hRAD54 by homology between the amino acid concernates given in AAW62186 and known amino acid sequences such as yeast CC RAD54. hRAD54 proteins are used in the treatment of cancer, including CC varoderma Pigmentosum and Bloom syndrome, Werner's syndromes and X-linked contains are used in the treatment of cancer. Including CC kRAD54 polymucleotides are also useful for detecting complementary CC incleotides for use as a diagnostic agent, especially useful for cuseful in canc therany in complementary in complementary.

                                                                                                              Primers GH28 and GH29 (AAQ15095 and AAQ15096, respectively), complementary to opposite strands of the conserved 5' and 3' ends of the DQ beta second exon were used to amplify sample fragments. Some HLA-DQ allele specific probes (including DH61) from two variable regions of the DQ beta second exon were designed based on an analysis of HLA-DQ beta sequences from diverse sources which were grouped into allelic variants. The probes were found to have reasonable specificity for the portions of the allele being detected in genomic DNA samples. See AAQ15093-Q15112. (Updated on 25-MAR-2003 to correct PF field.) Also described: (1) a method for determining the phenotypic preference of a first codon in an organism interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                             for detecting sequence variation directly. RS17, RS18 and RS21 are used to distinguish normal alleles (A) from sickle cell alleles (S) from haemoglobin C disease alleles (C). GH66, GH67, GH68 and GH75 are in the amplification and detection of HLA-DQ-alpha sequences. GH60, GH61, GH62, GH69, GH70 and GH71 are used in the amplification and detection of HLA-DQ beta sequences. GH51, GH56, GH57, GH58 and GH59 are used in the amplification and detection of HLA-DR-beta sequences. RS31, RS32 and RS33 are used in a process to amplify the genomic DNA from a known normal individual, a known sickle cell individual, and an individual with no beta-globin gene sequences (GM2064). XX1, XX2, XX3 and XX4 were used to isolate human genomic DNA from clinical samples of various beta-thalassemia genotypes. RS24 was used to isolate the normal beta-globin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence of HLA-DQ-beta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encodes the polypeptide. The method is useful for constructing a synthetic polynucleotide from which a polypeptide is producible to confer synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                         08-NOV-2002; 2002US-0425163P

```
codon with a synonymous codon
  to construct
  the synthetic polynucleotide
```

CC the method above; (3) an organism or interest or part containing a grithetic polynucleotide constructed from the method above; (4) an CC synthetic polynucleotide constructed from the method above; (4) an CC organism or interest or part containing a synthetic construct that CC comprises a regulatory polynucleotide operably linked to a trandem repeat CC encodes a regulatory polynucleotide operably linked to a trandem repeat CC encodes a reporter protein, which produces, or is predicted that CC encodes the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; and (7) a method of enhancing the quality of a ccodes the polypeptide; and (7) a method of reducing the quality of a ccodes the polypeptide. The method is useful for constructing a ccodes the polypeptide. The method is useful for constructing a selected phenotype that is displayed by an organism of interest or part ccodes the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different ccodes the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different ccodes the polypeptide. It is useful for modulating the quality of a selected phenotype to an organism or interest or part in a different ccodes the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or interest or part in a nexamile from the resent. phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from phenotype displayed by an organism or part. The present s a synthetic leader sequence, which is used in an example different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of The present invention polynucleotide from synonymous codon is selected on the basis that it exhibits sotide from which a polypeptide is producible to confer a phenotype to an organism of interest or part in a different polynucleotide for describes a method for constructing a synthetic replacement with a synonymous codon, from the

                                                                                                                                                                                                           The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest.
determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an organism or interest or part containing a synthetic construct that comprises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that encodes a reporter protein, which produces, or is predicted to produce selected phenotype or a phenotype of the same class as the selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 18 BP; 0 A; 12 C;
